Pareurystomina scilloniensis Warwick, 1977 (Fig. 118)

Description. Body length 7.1–7.8 mm. Maximum diameter 71–80 μ m (a = 88–110). Cuticle smooth. Six labial papillae small, rounded. Cephalic setae 16 and 6.5 μ m (male), 19 and 7.5 μ m (female). Buccal cavity with single right subventral tooth slender, pointed; two complete circles of large denticles and an incomplete circle of very fine denticles. Amphids 10–12 μ m wide, dorsolateral. Oesophagus 0.16 times body length, no posterior bulb. Excretory pore opens at level of cephalic setae. Flattened cervical setae extend posteriorly as far as the nerve ring. Tail tapering to a fine point, 4 a.b.d. (male), 6 a.b.d. (female).

Spicules arcuate, hooked distally, 82 μ m long.

Gubernaculum dorsally directed, solid, $37 \mu m$. Male tail with a pair of subventral double-pointed papillae about half-way down its length. Two winged supplements about 4 and 7 a.b.d. in front of cloaca, wings small and symmetrical. A small raised area of cuticle pierced by a fine pore about 1.5 a.b.d. in front of cloaca. A pair of short setae immediately anterior to cloaca.

Vulva at 69% of body length.

Distribution. Isles of Scilly (fine sublittoral sand).
