

Trichethmolaimus hirsutus (Gerlach, 1956) comb. nov.
(Fig. 2a)

Spiliphera hirsuta Gerlach, 1956

MATERIAL STUDIED. Several $\sigma\sigma$, collected by Mr P. J. D. Lamshead.

LOCALITY. Clyde Sea, Scotland.

REMARKS. The specimens were only studied in sufficient detail to ascertain the following features: 10 typical cup-shaped precloacal supplements present; two opposed testes. The fixation-shape is characteristically a tight coil, so that detailed study will be difficult: thus far, few uncoiled specimens have been encountered.
